## I. Team Structure & Development Strategy

The Belbin's self-perception exercise is a test that each group member completes to find out the type of role the person will be best suited when working in a group. The exercise consists of 7 sections, each section has 8 statements that the person has to give a score and each section has to add up to 10. The highest statement mark will identify what the group member is best at. Every team member in our group (Ian, Robert and Justin) completed the Belbin's self-perception exercise and below is a summary of the outcome.

### **Justin:**

The results came through as a College Worker. This means he is conservative, dutiful and predictable. He has the organisational skills with a practical mind and common sense. These add up to make him a hard working disciplined team member. The downside is that he will struggle seeing new ideas. He scored two marks for the statement "I find it difficult to get started unless the goals are clear" which proves he needs a leader or guidance to help complete a given task.

### **Robert:**

The results came through as a Team Worker. This means he gets on with everyone, although can be sensitive to any comments given to him. He has the ability to respond to people and to situations when things are looking grim. Another positive point is that he has the ability to promote team spirit. A negative point is that he can be indecisive in a moment of crisis. He scored himself 4 marks for this statement "I find it difficult to lead from the front, perhaps because I am over-responsive to group atmosphere." To clarify, he means he feels he can't be an active leader because he's very sensitive to the group's atmosphere. He scored himself 1 for the following statement: "I would be ready to work with the person who showed the most positive approach." He obviously believes that he won't just work with the person who shows the most positive approach; he will instead work with everyone.

### **Ian:**

The results came through as a Team Worker and College Worker. This means he's a bit of both as he "finds it difficult to get started unless the goals are clear" (college worker) and he has "a quiet interest in getting to know colleagues better" (team worker). All in all, Ian is practical, has common sense and has the ability to response to other group members.

In conclusion, we all had a similar result of Team Worker and College Worker. This shows that we're all hard working and should work well together. We do not have anyone who has been identified as a chair but we will try hard to each take a role of leading the group.

The waterfall model is a suitable development methodology tool to use as its widely used in most software development projects. The waterfall model is split up into 6 stages normally listed below:

**Requirement Phase:** this includes all the user requirements, system requirements and any specifications that the final product will need.

**Specification Phase:** this phase is where the exact requirements and specifications

are put together to output the way the system should turn out to be.

**Design Phase:** this phase is where the visual and the logical design are planned. Visual designs would be the front end where the end user will see and the logical designs are the databases and data storage plans.

**Testing & Implementing Phase:** this phase is where the developer tests the system, checks to see if there are any flaws or error and makes sure the system meets all the specifications. Once it's been tested then it's ready to be implemented.

**Maintenance Phase:** this phase is where the developer keeps the system updated with the changes made in the specification and provides support to the company if any errors happen.

As system developers we will use the Waterfall model, as it is easy to understand and follow, it makes documenting easy as the developer can use each phase as a template. Each phase relies on the previous phase so it's a good method to follow when system developing. The waterfall method is better for longer project that need to be highly accurate, which our project is. The waterfall method is also useful for developing systems that use familiar technology and project with clear requirements.

Divide and conquer is a simple and easy method to use to find when trying to identify the root causes and effects of a problem within a system. Fish bone diagrams are very basic and doesn't really help fix a problem. All it does is just shows the programmer the map of the program where as the divide and conquer method allows the programmer to break down the software and look at each section and solve one section at a time. This is a good way of testing the software as well.

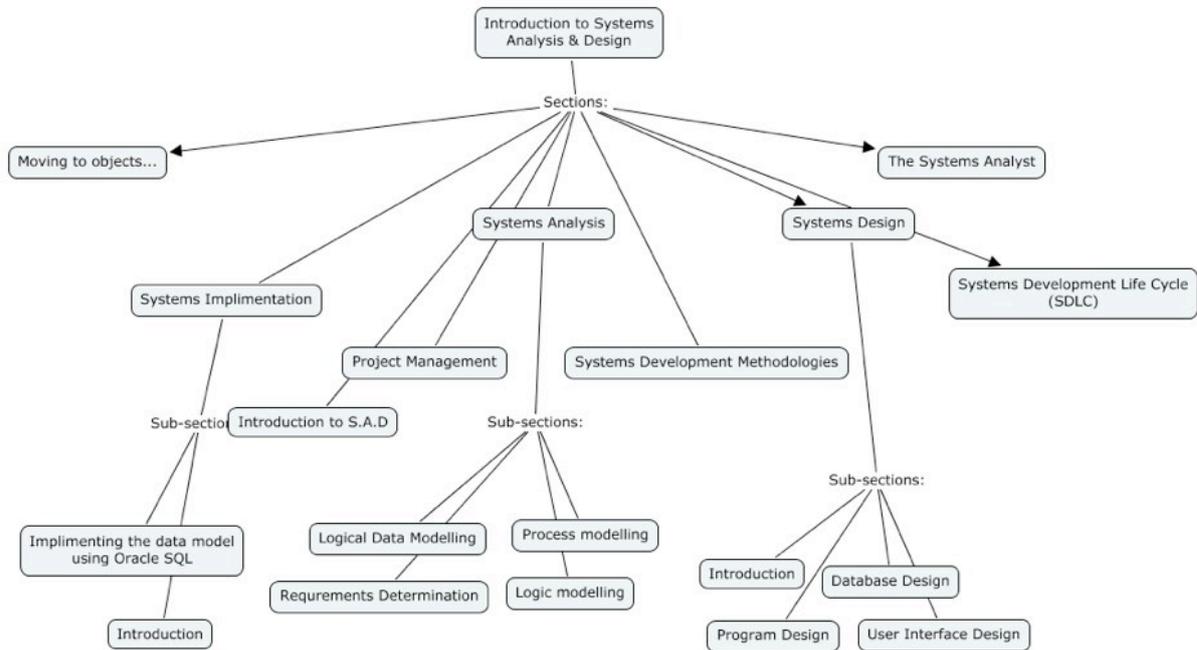

If an error occurs with a system, the system developer may investigate the problem by looking at the program and breaking it down into local sections which can be tested separately to find out where the issue lies. For example, the developer may find that queries are giving an incorrect result. A logical way to assess this problem, using the divide and conquer method, would be to take the queries, tables, relationships, and the data it's self as separate parts of the system. Then each can be tested individually.

## II. Team Concept Map

A concept map is a diagram that is used to better understand and share knowledge. It breaks down a concept into hierarchical nodes and associates them with linking words. These nodes can contain text, images, and web links to further demonstrate understanding of the concept. An arrow that shows the direction of information accompanies the linking words. These linked arrows show the relationship between information and are intended to read like a sentence.

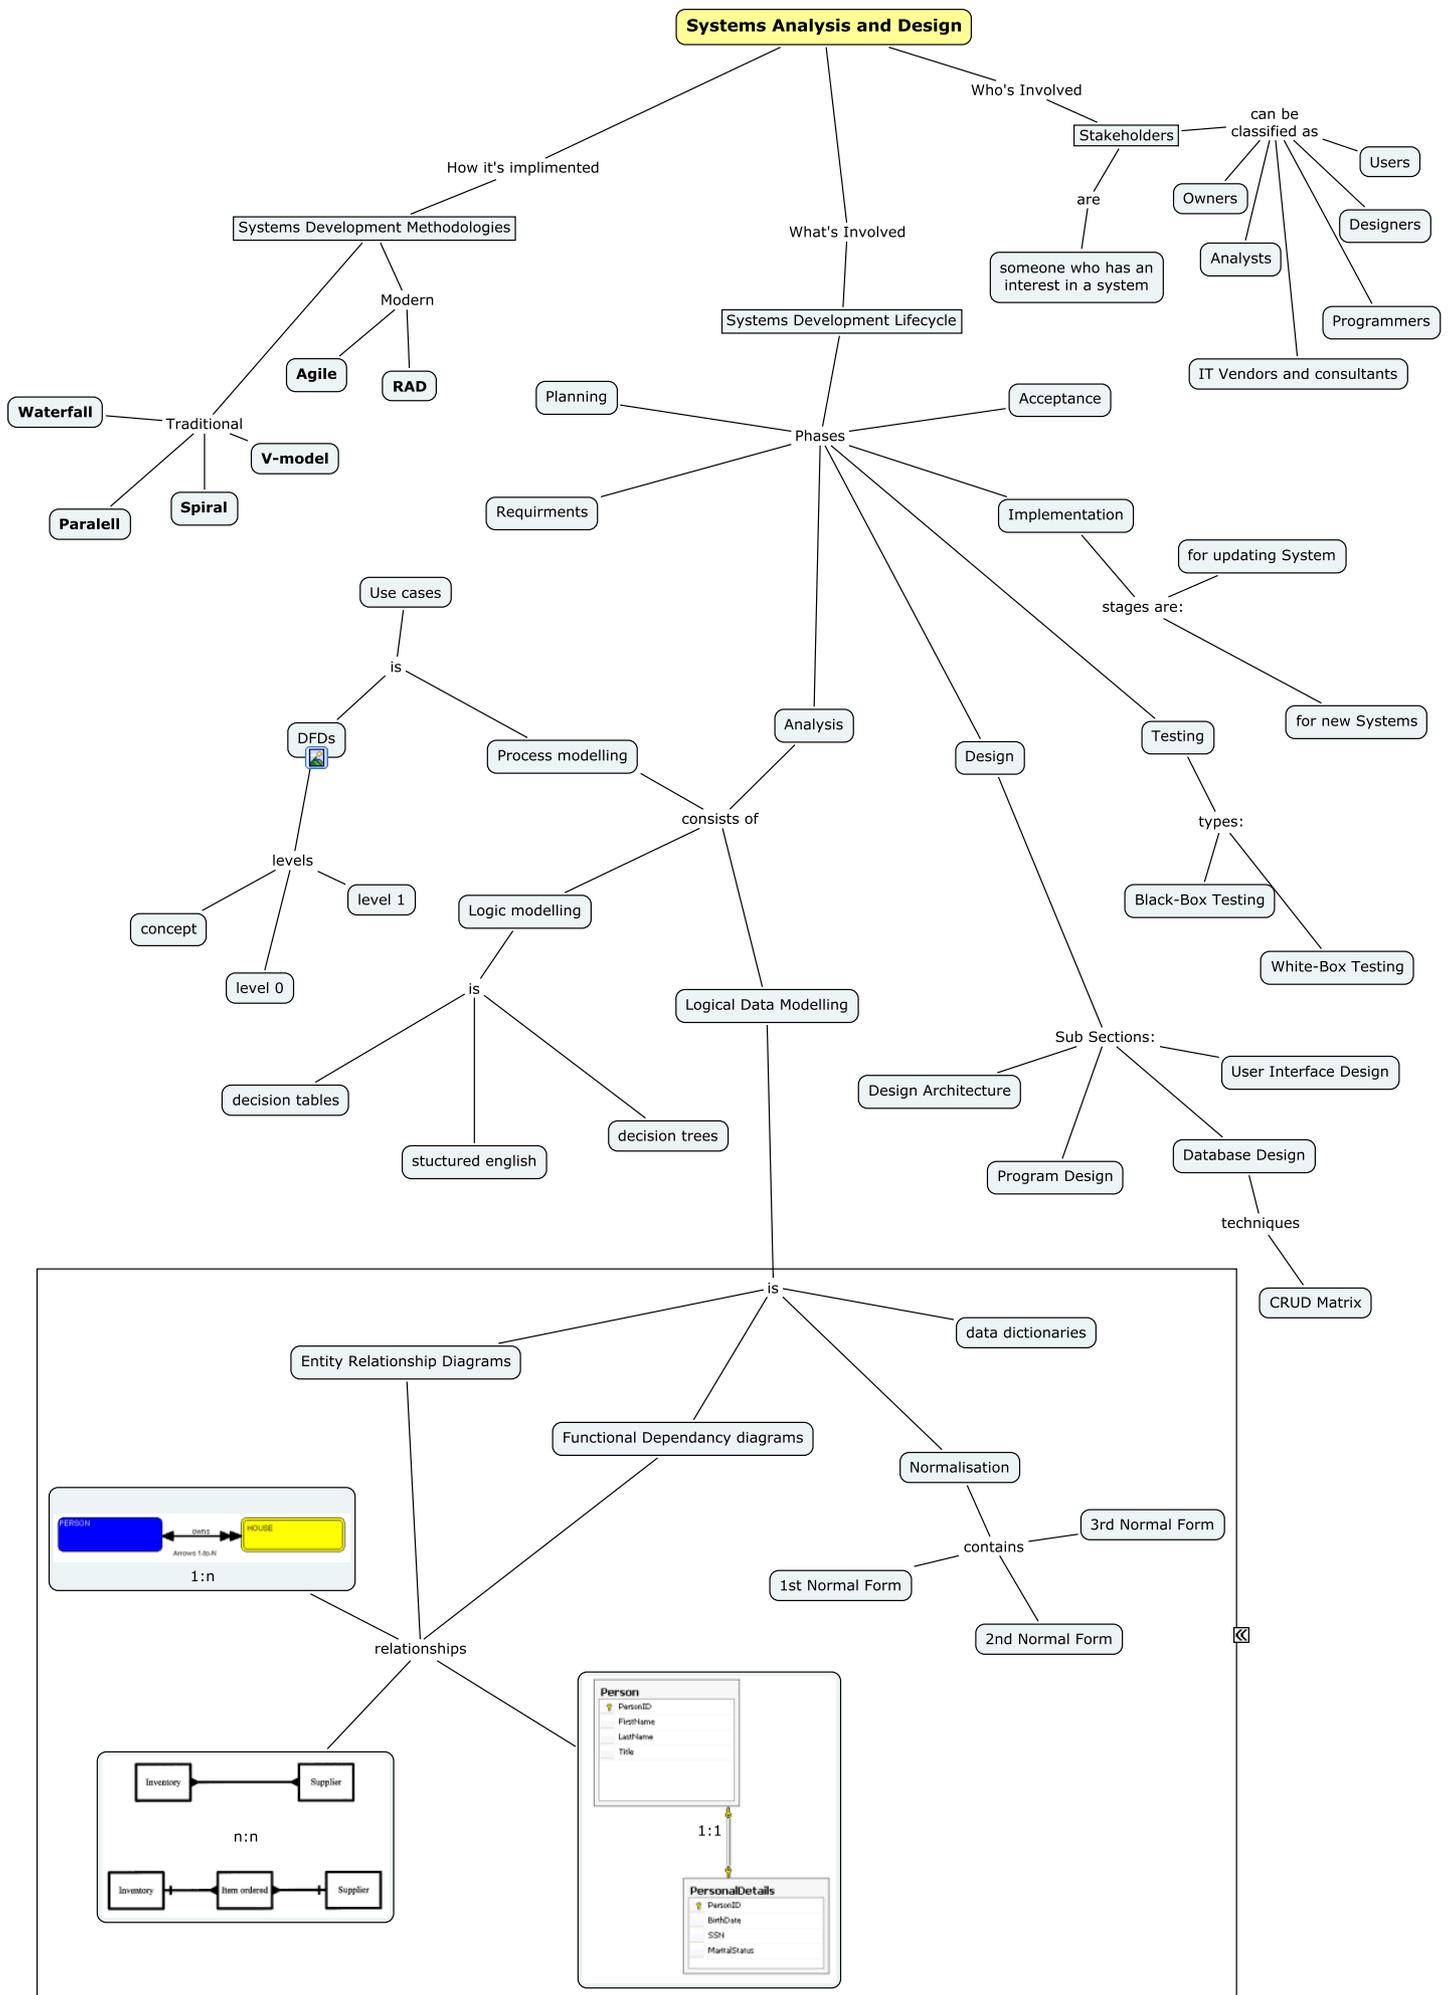

We used concept maps to illustrate our understanding of the ISAD module. Our initial concept map was very basic and had a small amount of nodes. We had limited knowledge of the subject and so our concept map was limited. After working further with the software, and gaining more knowledge of ISAD from the lectures we were able to make improvements to the concept map. We added new major topic nodes and elaborated existing nodes further to show new understanding.

Our concept map from Review point 1:

## IV. System Proposal

### Functional Requirements

A functional requirement is something that a system must be able to actively achieve. It may be a receiving a certain input, to processes something, or provide a specified output.

The following is a list of the functional requirements of the Employee Recruitment & Development system. Labels showing whether a requirement is found in the new or current system can be found in the brackets.

- FR1: Receive Applications (new)
- FR2: Receive Job Descriptions (new/current)
- FR3: Select for Interview (new/current)
- FR4: Evaluate and Recruit (new/current)
- FR5: Purge 1 Year Old Job Descriptions (new/current)
- FR6: Create Employee Record (new)

### Non-functional Requirements

A non-functional requirement is something that is asked of the system, but is not required for the system to function. The Employee Recruitment & Development system has a number of non-functional requirements, as follows.

- NR1: The system should not allow automatic updates to the Graduate Vacancies database (new)
- NR2: Graduates should be notified of acceptance/rejection within 2 months of application (new)
- NR3: The system should be in place within 18 months (new)
- NR4: Prototype should be in place within three months (new)
- NR5: Application software should be compatible with current network infrastructure
- NR6: All communication between the company and the graduates should be transmitted under secure conditions.

### Summary of Use Cases

To clearly show the details of the main functional requirements that were investigated with Use Case tables, we have produced a summary of the main features found for each process. This summary table outlines the purpose, inputs, and outputs of the requirements.

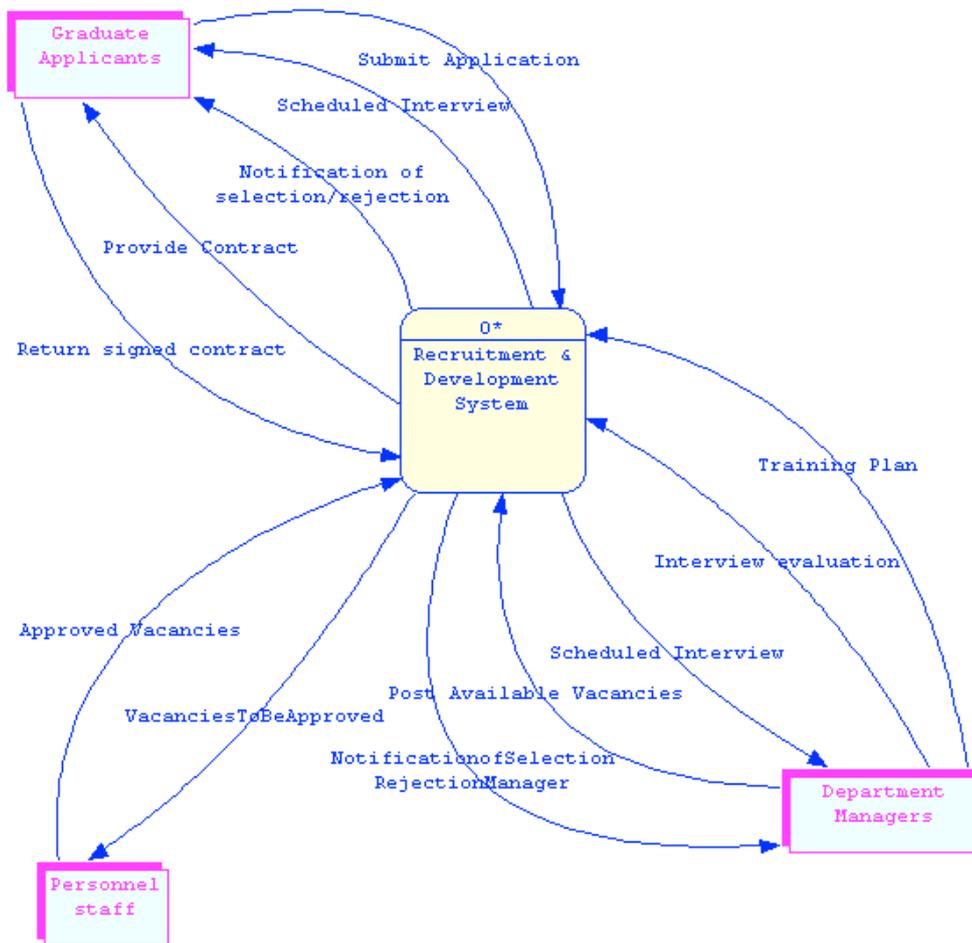

<u>Process No.</u>	1	2	3	4	5	6
<u>Name</u>	<b>Receive Applications</b>	<b>Receive Job Description</b>	<b>Select for Interview</b>	<b>Evaluate and Recruit</b>	<b>Purge 1 year old applications</b>	<b>Create employee record</b>

<u>Purpose</u>	To add applications into the pool	To add vacancies to the file	To select three candidates	To select a new recruit	To keep the database up to date	To store employee data
<u>Input</u>	Application form	Job Description	Graduate Applications, Job Descriptions	Interview evaluation, returned signed contract	All applications	New recruits' application form
<u>Source of input</u>	Graduate applicant	Department manager	Application pool, graduate vacancies	Department managers, recruited graduate	Application pool	Evaluate and recruit process
<u>Output</u>	Application data	Vacancies data	Scheduled interview, selected graduates	Notification of selection and provide unsigned contract, notification of rejection, rejected applications	Delete year old applications	New employee data
<u>Output recipient</u>	Application pool	Graduate vacancies	Graduate and department manager, evaluate and recruit process	Recruited graduate, rejected graduate, application pool	Application pool	Employee file

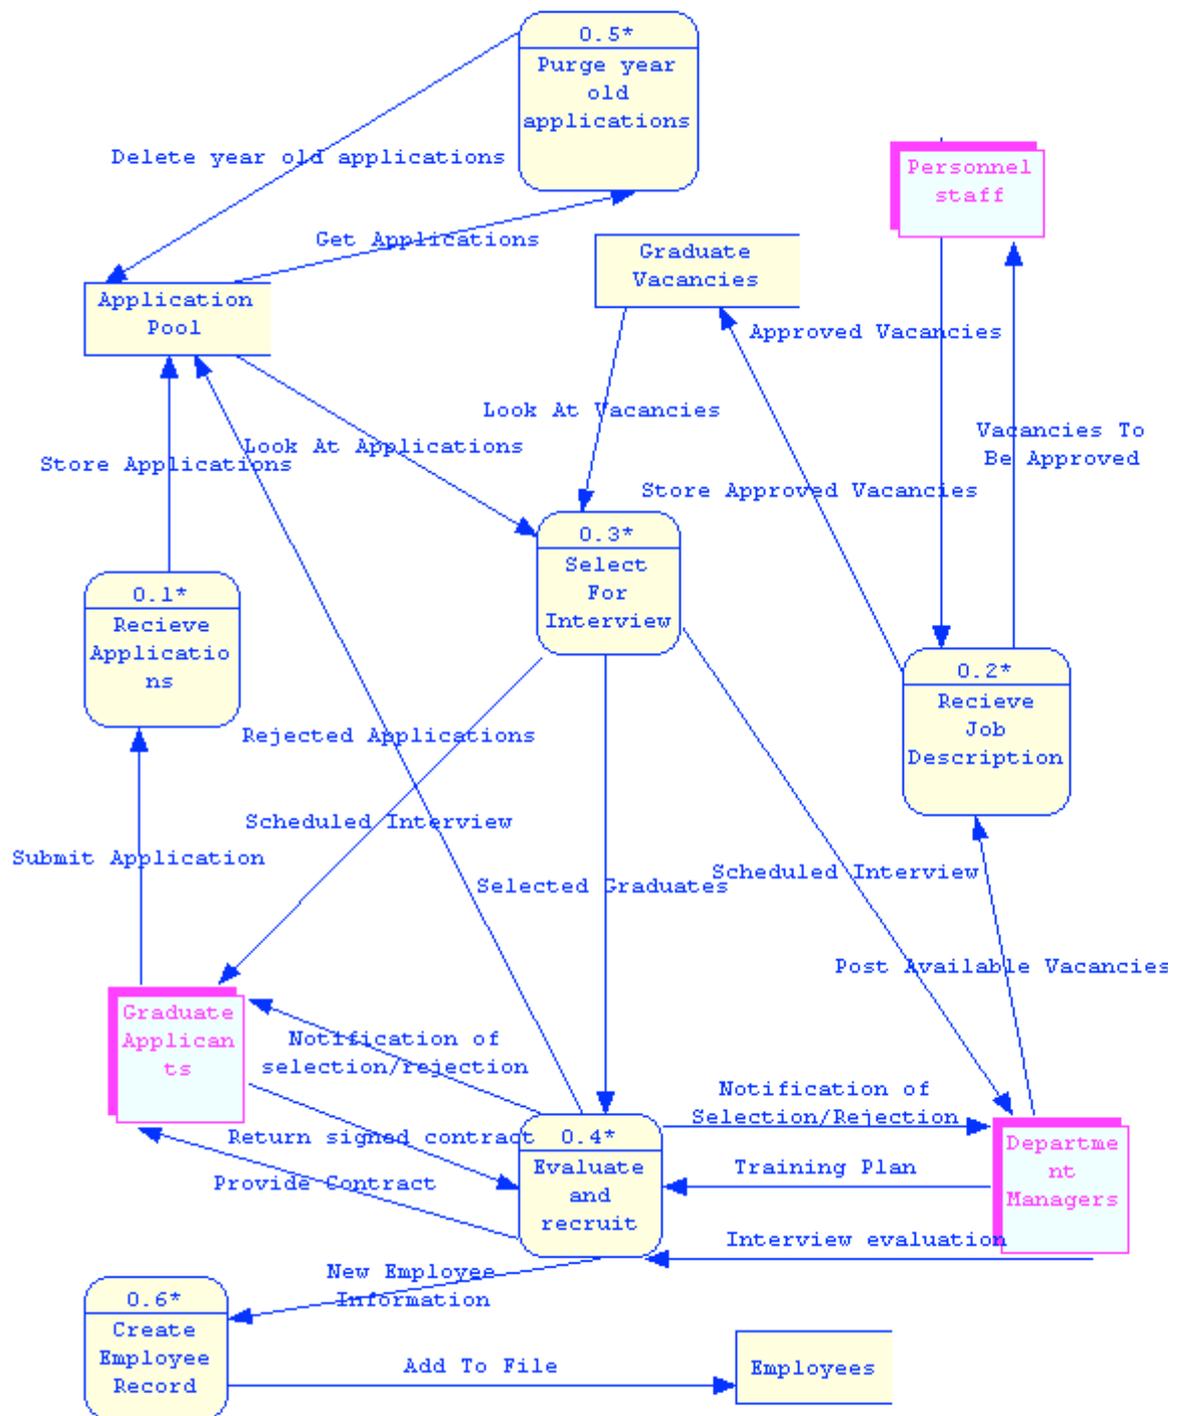

### Logical and Physical Process Models

To model the system, we used Data Flow Diagrams using the Gane and Sarson method. We generated DFDs using WinA&D, a CASE tool.

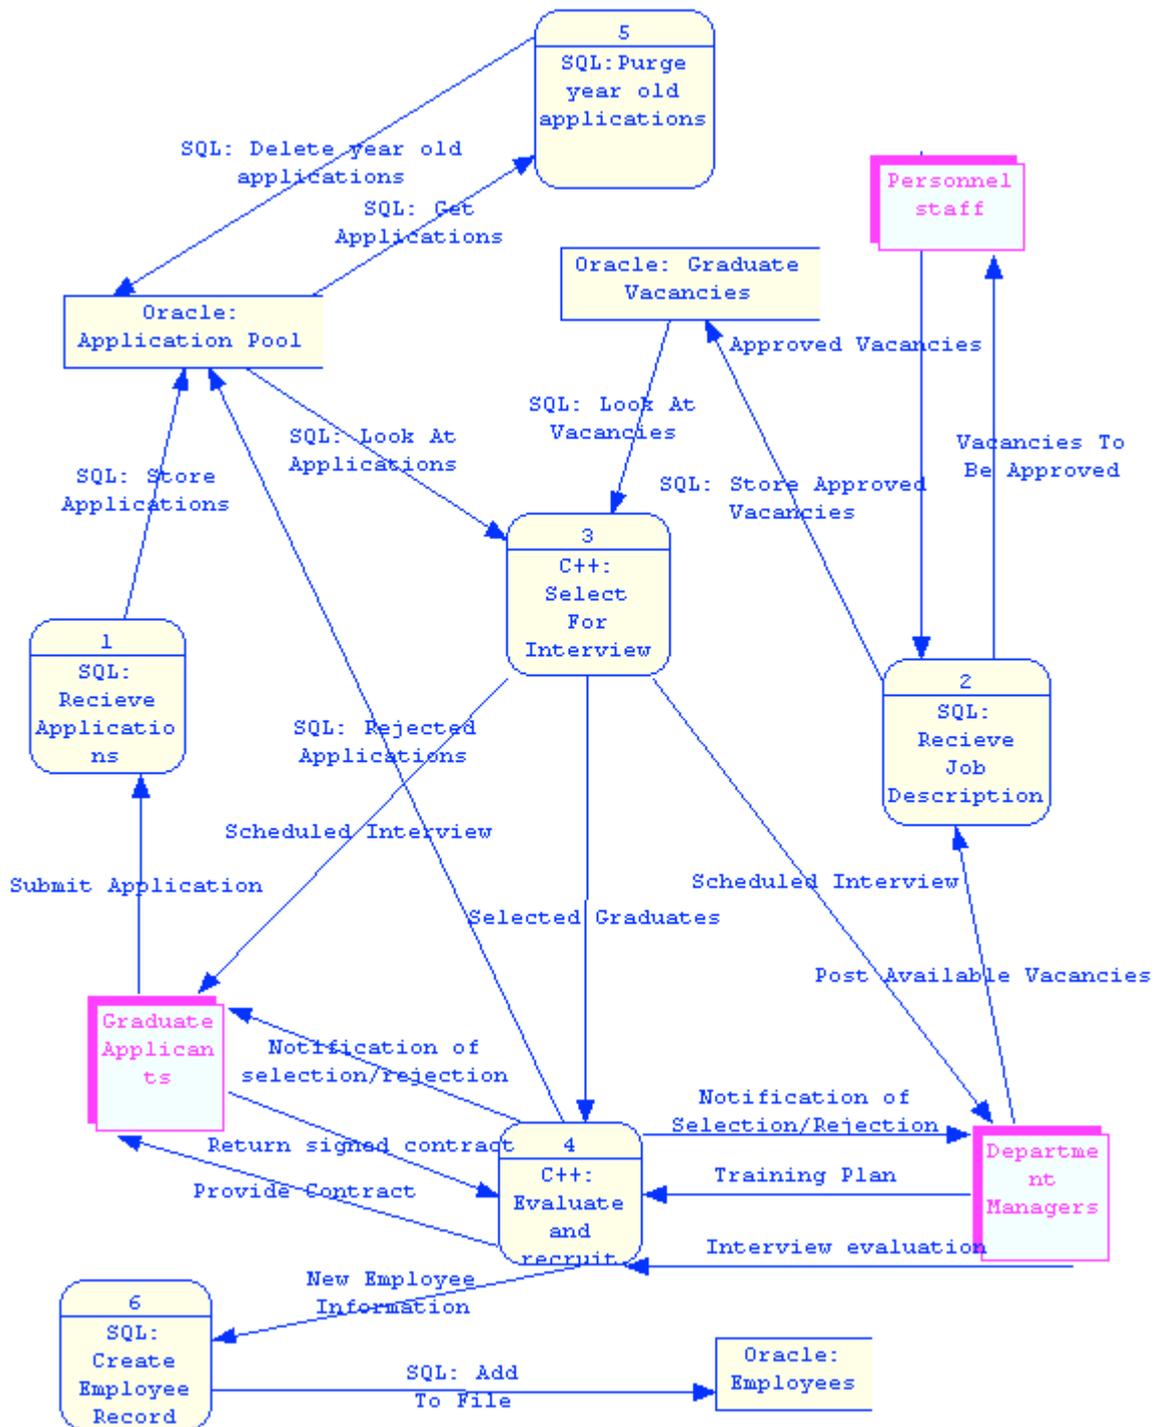

- Logical context level DFD. This shows the system as a whole. It depicts how external entities interact with the system by showing what data flows from an entity into the system.

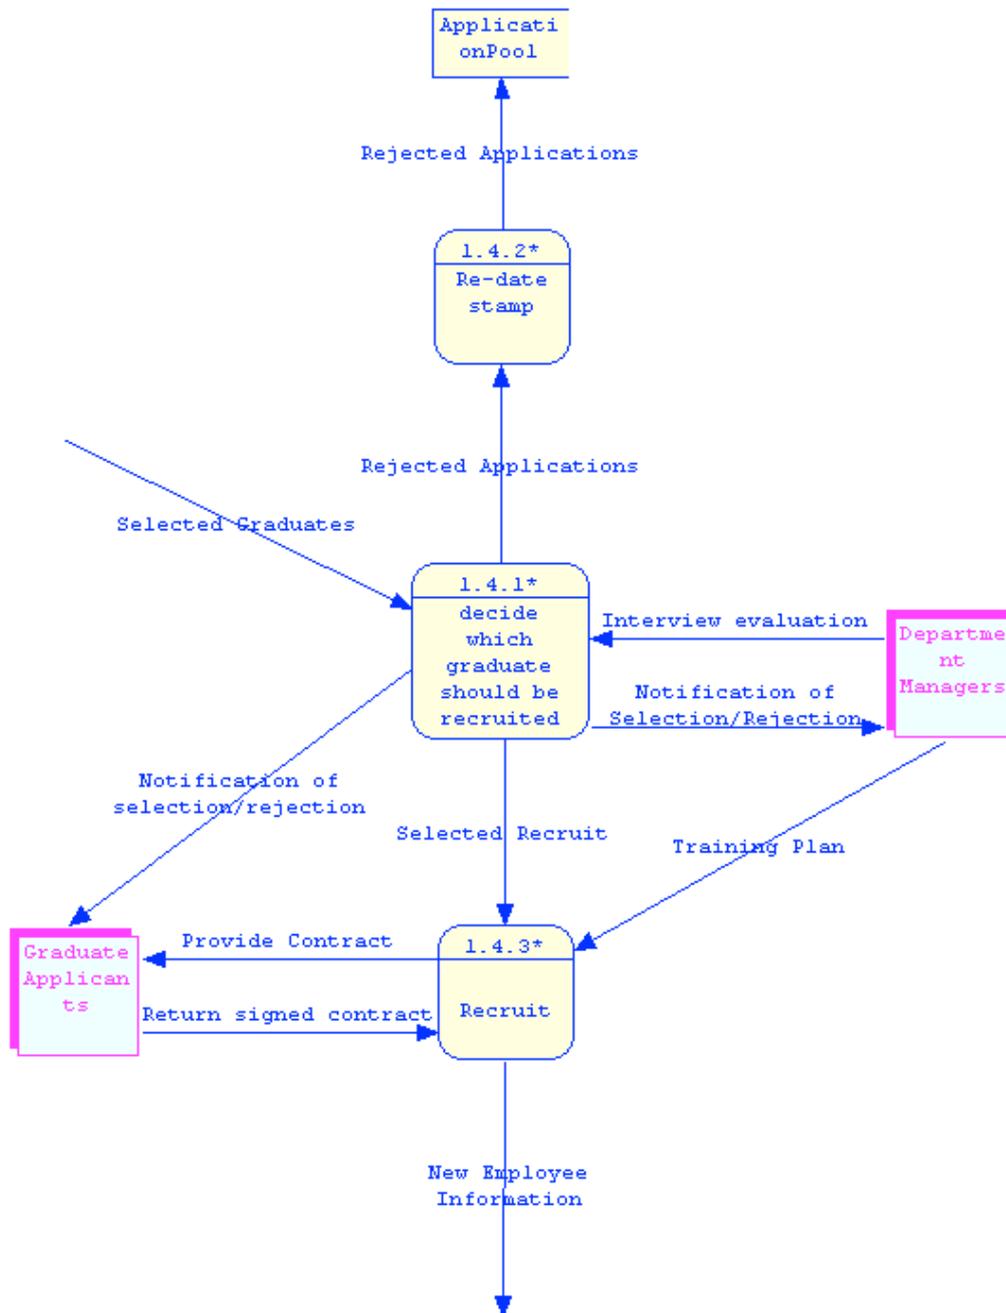

- Logical level 0 DFD. The logical level 0 DFD takes the system, and opens it up to reveal the main functional requirement processes. The model shows how data flows from and to entities. At level 0, we also include data stores and show what data will be passed to and from those.

- Physical level 0 DFD. The physical DFD at level 0 defines what technologies would be implemented on the processes and data stores.

- Logical level 1 DFD for a level 1 process: Evaluate and recruit process. This level 1 DFD gives a decomposed view of the 'Evaluate and recruit' process. It shows sub-processes and data flows inside the level 0 process.

**Processing Logic**

Below is a decision table demonstrating the processing logic behind the increase in salary for a graduate. It selects a percentage increase based on the type and level of degree the graduate has earned.

3 <sup>rd</sup> class degree?	Y	-	-	-	-	-	-	-
Degree with Hons?	-	N	Y	Y	Y	Y	Y	Y
Science degree?	-	-	Y	Y	Y	N	N	N
1 <sup>st</sup> class degree?	-	-	Y	-	-	Y	-	-
Upper second-class degree?	-	-	-	Y	-	-	Y	-
Lower second-class degree?	-	-	-	-	Y	-	-	Y
No Increase	X	X						
10%			X					
7%				X				
5%					X		X	
8%						X		
2%								X

**Normalisation and Logical/Physical Data Modelling**

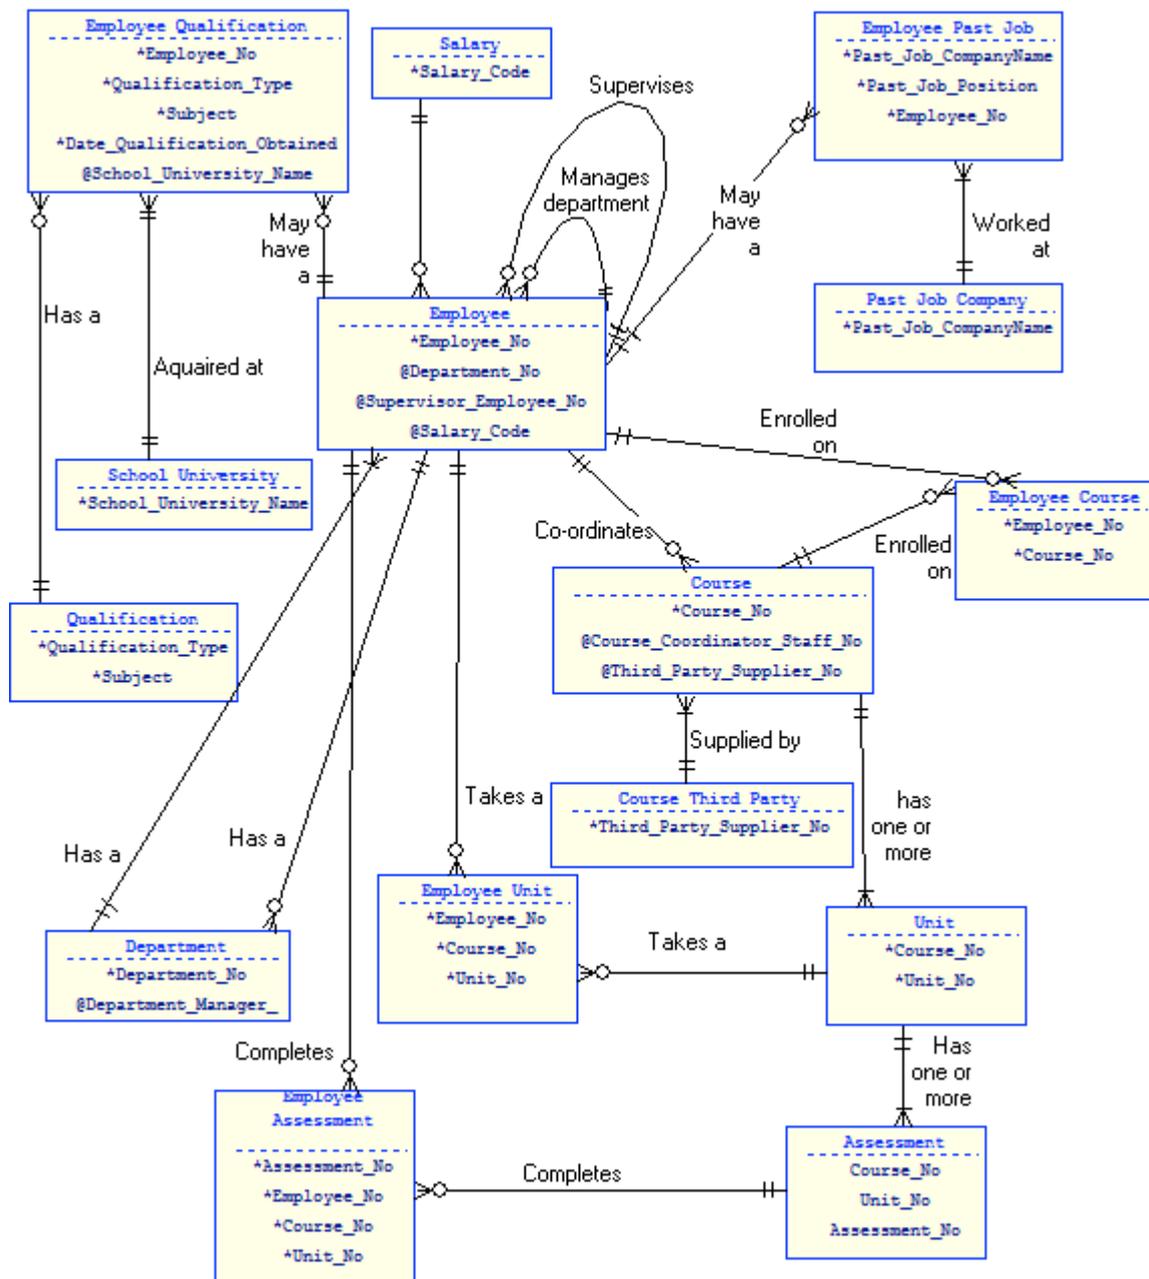

After taking the un-normalised attributes listed in the system description of the business profile and normalising them to Third Normal Form we reached a state of data entities that we feel are suitably normalised. Below are all the tables normalised to Third Normal Form. The stages of normalisation can be found in Appendix B.

<u>Employee table:</u> <b>*Employee_No</b> Employee_Name Employee_Address Job_Description Status Start_Date #Supervisor_Employee_No #Salary_Code #Department_No	<u>Salary table:</u> <b>*Salary_Code</b> Salary_Amount	<u>Department table:</u> <b>*Department_No</b> Department_Name Department_Location #Dept_Manager_Employee_No
<u>Employee Qualification table:</u> <b>*Employee_No</b> <b>*Qualification_Type</b> <b>*Subject</b> <b>*Date_Qualification_Obtained</b> Grade #School_University_Name	<u>Qualification table:</u> <b>*Qualification_Type</b> <b>*Subject</b> Awarding_Body Qualification_Description	<u>School University table:</u> <b>*School_University_Name</b> School_University_Address

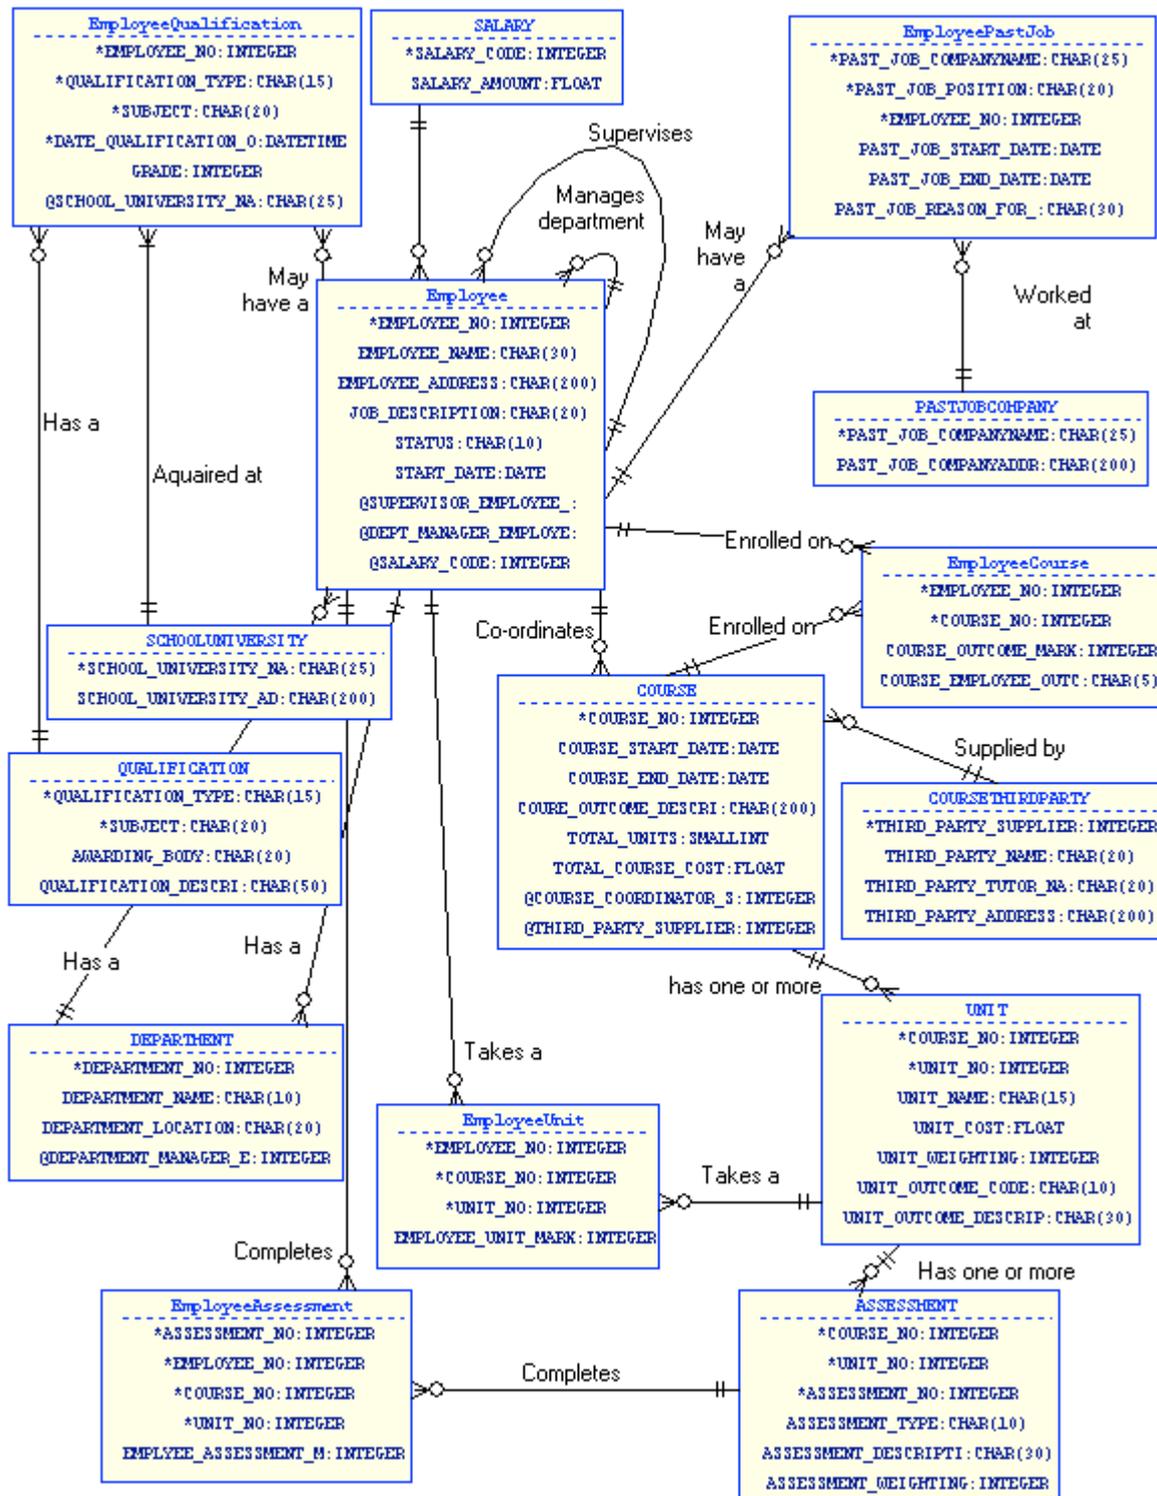

<u>Employee Past Job table:</u> <b>*Employee_No</b> <b>*Past_Job_CompanyName</b> <b>*Past_Job_Position</b> Past_Job_Start_Date Past_Job_End_Date Past_Job_Reason_for_Leaving	<u>Past Job Company table:</u> <b>*Past_Job_Company Name</b> Past_Job_CompanyAddress	<u>Course table:</u> <b>*Course_No</b> Course_Name Course_Start_Date Course_End_Date Course_Outcome_Description Total_Units Total_Course_Cost #Third_Party_SupplierNo #CourseCoordinator_Staff_No
<u>Third Party Supplier table:</u> <b>*Third_Party_SupplierNo</b> Third_Party_Name Third_Party_Tutor_Name Third_Party_Address	<u>Employee Course table:</u> <b>*Course_No</b> <b>*Employee_No</b> Course_Employee_Mark Course_Employee_Outcome_Code	<u>Unit table:</u> <b>*Unit_No</b> <b>*Course_No</b> Unit_Name Unit_Cost Unit_Weighting Unit_Outcome_Code Unit_Outcome_Description
<u>Employee Unit table:</u> <b>*Unit_No</b> <b>*Course_No</b> <b>*Employee_No</b> Employee_Unit_Mark	<u>Assessment table:</u> <b>*Assessment_No</b> <b>*Course_No</b> <b>*Unit_No</b> Assessment_Type Assessment_Description Assessment_Weighting	<u>Employee Assessment table:</u> <b>*Assessment_No</b> <b>*Unit_No</b> <b>*Course_No</b> <b>*Employee_No</b> Employee_Assessment_Mark

To demonstrate our knowledge of normalisation, we created a new attribute at First Normal Form to be used as part of a compound key for attributes relating to assessments. We found that there was not a good enough attribute to uniquely define an assessment of a unit, even when we created a compound key using Employee\_No, Course\_No and Unit\_No. Assessment\_Type would seem like a viable solution but we found this does not adequately identify examples of a unit that has more than one exam, for instance. To properly define an assessment of a unit, we created the Assessment\_No field. This will give each assessment within a unit a unique number, allowing multiple exams (or indeed any other type of assessment) with different weightings to be assigned to a unit.

From the Third normal form entities, we created a logical data model that shows all key attributes (both primary and foreign). We also linked related entities with each other using a relevant relationship, which is determined by our use of primary and foreign keys.

To demonstrate the physical data model, we have produced an Entity Relationship Diagram that lists the entity tables, their relationships, and all attributes with their data types.

### CRUD (Create Read Update Delete) Matrix

To demonstrate how each of the processes affects the data stores in the system, we created a CRUD matrix. This shows which processes create, read, update or delete information from certain data stores.

Process	1. Receive Applications	2. Receive Job Descriptions	3. Select for Interview	4. Evaluate and Recruit	5. Purge 1 year old applications	6. Create Employee Record
Data store						
Application Pool	C		R	U	RD	
Graduate Vacancies		C	R			
Employees						C

### Proposal for Change

To make the models meet the system request for the Employee Recruitment & Development project, they would need to be updated.

To enable graduates to post their applications online, a website would have to be created. Data from a form on this website would flow into the Receive Applications process. In the physical model, the process would be composed of HTML and PHP, the data flows would be SQL to enable the website to interface with the Application pool. As the new system is required to maximise paperless contact between entities within and external to the company, it would be necessary to gather graduate applicants email addresses along with their application. This would enable the company to electronically notify graduates of their selection/rejection. In the physical model, the data flows to the Graduate Applicant entity could all be implemented through email.

The system request also states that department managers want to be able to document and recommend salary increases to be considered by senior management. As this is required to be implemented over the companies' intranet, another process in HTML and PHP would be needed to facilitate SQL data flows to the Graduate Vacancies data store. Once the suggested salary increase had been added to the system, a flag would need to be set to allow senior management to see which vacancies had salary increases to be considered.

Finally, the system request asks that the new system should enable department managers to forward training plans to Human Resources before a new employee starts. The training plan will be tailored to the new employee's needs. Currently this happens after an employee signs their contract but if a department manager is able to get the plan ready before the employee has joined the team then the employee will be able to integrate faster and easier into the team. To enable this in the DFDs, information about the potential employees will need to be sent to department managers so that they can tailor the plan to them. Once this is done, there will need to be a new process to facilitate transferring the training plan from the department managers and to Human Resources. This will be using the companies' intranet so it will be HTML and PHP based using SQL for the interfacing with data stores.

## V. Evaluation

As the above work demonstrates, we have experienced the systems development processes. In this evaluation we will reflect on this experience and we will discuss successful aspects of our group work, and which parts have room for improvement.

An integral part of any project is planning. We found planning and organising our project difficult, our group is the result of a two-group merge, which occurred because of a number of people leaving in the early stages of this module. This meant that we had to quickly adjust to the new environment and our new colleagues. Initially we set out to have meetings once every two weeks, but this didn't happen. We ended up having meetings monthly and communicating mostly through email. This method worked well for us although we may have been more organised if we did have more meetings.

Our team worked well collaboratively. Once work was divided equally we all carried out our selected tasks and then used meetings to splice the work together to create our deliverables. To assist our collaborative working, we used [www.dropbox.com](http://www.dropbox.com) to create a cloud-based folder that we can access from anywhere with an Internet connection. A bonus over the NOW-based file sharing provided by the University is that with a small application provided by Dropbox, a folder on our personal computers can be made to be constantly in synchronisation with the cloud-based folder.

From taking part in this project and working through all the tasks we feel that the process of this project could be improved by implementing a fairer system for grouping members.

We found that concept mapping was not helpful in assisting us to learn. We concluded that it might be useful for people with different learning styles to our own but our example-based learning style was not aided by the abstract and conceptual nature of concept maps.

We found Microsoft Project to be a very interesting and useful tool in laying out a roadmap of a project. Although we found estimating times for each piece of work to be difficult, once we had included task dependencies we could see how the project would progress.

The CASE tool that we used throughout this project, WinA&D, was one of great discussion. On the one hand, it seems to have a huge learning curve, is very difficult to master, and seems to have a few limitations and bugs. However, once we understood how to carry out the tasks that we needed, it is powerful and has the ability to create the types of models that we require.

One feature that we think would be very useful in WinA&D is automatic relationships in Entity Relationship Diagrams. As the attributes for each table are stored in the

program, once we assign primary and foreign keys to entities, the program could have a function that automatically links tables based on the keys that we have entered. This would speed up the creation of ERDs and would also ensure that the type of relationship is always accurate.

## **Appendix A. Minutes of Meetings**

### **Date: 16<sup>th</sup> December 2010**

Where: CIB

Who attended? : Justin Bankwa, Robert Shippey and Ian Jayes

Meeting leader: Ian Jayes

Starting time: 01:30pm

Finishing time: 02:15pm

Contents:

- Group 3 and 4 merge and prepare for the review point 2 on 17<sup>th</sup> January 2011.
- We decided to subdivide task to work in during the Christmas period
- Set up a Dropbox account

Decision:

- Tasks subdivide and set a deadline
- Ian Jayes: put in order all the earlier version of the concept map
- Robert Shippey: uses cases and project plan and draft process models
- Justin Bankwa: project plan
- Set a meeting every fortnight

Meeting taker: Justin Bankwa

### **Date: 10<sup>th</sup> January 2011**

Where: CIB

Who attended? : Justin Bankwa, Robert Shippey and Ian Jayes

Meeting leader: Robert Shippey

Starting time: 02:15

Finishing time: 03:40pm

Contents:

- Review point 2
- Everyone's work done
- Improvement
- Final version

Decision:

- An emergency meeting on 13<sup>th</sup> January 2011 to evaluate the work for the 17<sup>th</sup> January 2011's review point

Meeting taker: Justin Bankwa

**Date: 13<sup>th</sup> January 2011**

Where: CIB

Who attended? : Justin Bankwa, Robert Shippey and Ian Jayes

Meeting leader: Robert Shippey

Starting time: 12:00pm

Finishing time: 01:00pm

Contents:

- Review point 2
- Final version

Decision:

- Project plan and work breakdown by Justin Bankwa
- Concept map by Ian Jayes
- Use case and (data flow diagrams) by Robert Shippey
- Next meeting on 27<sup>th</sup> January 2011

Meeting taker: Justin Bankwa

**Date: 27<sup>th</sup> January 2011**

Where: CIB

Who attended? : Justin Bankwa, Robert Shippey and Ian Jayes

Meeting leader: Robert Shippey

Starting time: 12:00pm

Finishing time: 12:35

Contents:

- Review point 3
- Task subdivision
- Justin Bankwa: research about the Cmap and prepare for the introduction
- Ian Jayes: put in order all the earlier version of the concept map
- Robert Shippey: finalise the latest version of the concept map

Decision:

- Tasks subdivide and set a deadline
- Final version on the 07<sup>th</sup> February 2011 in the group Dropbox
- Next meeting on 10<sup>th</sup> February 2011

Meeting taker: Justin Bankwa

**Date: 10<sup>th</sup> February 2011**

*Employee Recruitment & Development Project*

Where: CIB

Who attended? : Justin Bankwa, Robert Shippey and Ian Jayes

Meeting leader: Robert Shippey

Starting time: 12:00pm

Finishing time: 14:35

Contents:

- Review point 3
- Justin Bankwa: finalise and bring the research about the Cmap and prepare for the introduction
- Ian Jayes: finalise and bring put in order all the earlier version of the concept map
- Robert Shippey: finalise and bring finalise the latest version of the concept map

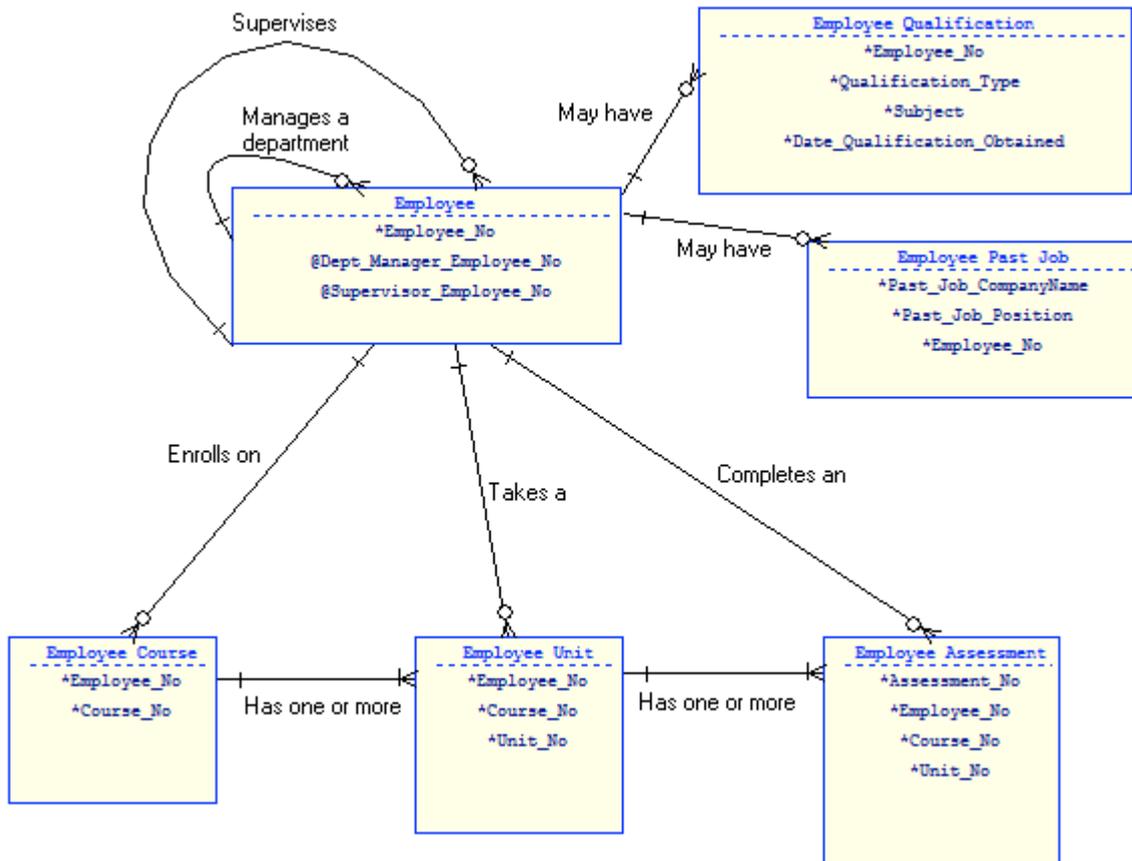

Decision:

- Justin Bankwa will start the PowerPoint presentation
- Ian Jayes will present all the earlier version of the concept map
- Robert Shippey: will present the latest version of the concept map and the Cmap features

Meeting taker: Justin Bankwa

### Appendix B. Stages of Normalisation

### Appendix C. Detailed Use-Case Tables

This appendix contains the full details for each use-case for the six functional requirements.

<b>Use Case name:</b> Receive Applications		<b>ID:</b> FR1	
<b>Short Description:</b> Information from the graduates application form is inserted into the application pool.			
<b>Trigger:</b> Graduates post an application to the website or a postal paper application is received.			
<b>Type:</b> <b>External</b> /Temporal			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
Application form	Graduate applicant	Application data	Application pool
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>• Online application: <ul style="list-style-type: none"> <li>○ Data from the online application is date stamped</li> <li>○ Then inserted into the application pool</li> </ul> </li> <li>• Postal application: <ul style="list-style-type: none"> <li>○ The data from the paper application is typed into an online application, by an employee</li> <li>○ This is then date stamped</li> <li>○ And inserted into the application pool</li> <li>○ The paper application form is then archived</li> </ul> </li> </ul>		<ul style="list-style-type: none"> <li>• Date the application has been received</li> <li>• Graduate's data, such as: <ul style="list-style-type: none"> <li>○ Title</li> <li>○ Name</li> <li>○ Address</li> <li>○ Qualifications</li> <li>○ Previous work experience</li> <li>○ Skills</li> <li>○ Courses attended</li> </ul> </li> </ul>	

<b>Use Case name:</b> Receive Job Description		<b>ID:</b> FR2	
<b>Short Description:</b> Receive a job description from a department manager and write it into the 'Graduate vacancies' file.			
<b>Trigger:</b> A department manager posts a job description to the system.			
<b>Type:</b> <b>External</b> /Temporal			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
Job description	Department manager	Vacancies data	Graduate vacancies
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>The incoming job description is date stamped</li> <li>The job description data is written to the graduate vacancies file</li> </ul>		<ul style="list-style-type: none"> <li>Job description</li> <li>Essential skills and qualifications</li> <li>Desirable skills and qualifications</li> <li>Number of positions available</li> <li>Recommendation for increase in base salary for successful applicants</li> </ul>	

<b>Use Case name:</b> Select for Interview		<b>ID:</b> FR3	
<b>Short Description:</b> Compares graduates in the pool of applicants with essential and desirable requirements of each job description, then schedules interviews between graduates and the corresponding managers.			
<b>Trigger:</b> This process will be run on the first day of the recruiting window			
<b>Type:</b> External/ <b>Temporal</b>			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
Graduate applications	Application pool	Scheduled interview notification	Graduate
Job descriptions	Graduate vacancies	Scheduled interview notification	Department manager
		Selected graduates	Evaluate and recruit
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>• Takes all graduates in the application pool</li> <li>• Compares applications to the requirements of a job description</li> <li>• Selects three graduates that best fit the description</li> <li>• Notifies the department manager of the three selected graduates</li> <li>• Notifies the three selected graduates that they have been chosen</li> <li>• Schedules interviews between each selected graduate and the corresponding manager</li> <li>• Passes the three selected graduates into the evaluate and recruit process</li> </ul>		<ul style="list-style-type: none"> <li>• Essential and desirable requirements</li> <li>• Qualifications, work experience, and skills of the graduates</li> <li>• Selected graduates contact information</li> <li>• Department managers contact information and calendar</li> </ul>	

<b>Use Case name:</b> Evaluate and Recruit		<b>ID:</b> FR4	
<b>Short Description:</b> Of the three selected graduates, one is selected based on their application and the evaluation of the candidates interview with the manager. The one selected candidate is then recruited.			
<b>Trigger:</b> Receiving the evaluation of the three selected graduates interviews.			
<b>Type:</b> <b>External</b> /Temporal			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
Interview evaluation	Department managers	Notification of selection	Recruited graduate
Returned signed contract	Recruited graduate	Notification of rejection	Rejected graduates
		Provide unsigned contract	Recruited graduate
		Rejected applications	Application pool
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>• Receive interview evaluation</li> <li>• Make a decision on which graduate should be recruited</li> <li>• Notify the department manager which graduate has been recruited</li> <li>• Notify the recruited graduate they have been selected</li> <li>• Notify the rejected graduates that they have not been chosen for this position (but their applications have been put back into the pool)</li> <li>• Rejected applications are re-date stamped</li> <li>• Rejected applications are stored back into the application pool.</li> </ul>		<ul style="list-style-type: none"> <li>• Interview evaluation</li> <li>• Contract</li> <li>• Graduates contact information</li> <li>• Department managers contact information</li> <li>• Selected applications</li> </ul>	

<b>Use Case name:</b> Purge 1 year old applications		<b>ID:</b> FR5	
<b>Short Description:</b> Delete all applications in the application pool that are a year old.			
<b>Trigger:</b> This process is started everyday to ensure that the pool is regularly kept up to date.			
<b>Type:</b> External/ <b>Temporal</b>			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
Look up all applications	Application pool	Delete all year old applications	Application pool
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>• Look up applications that have a date stamp that is a year old</li> <li>• Delete these applications</li> </ul>		<ul style="list-style-type: none"> <li>• Today's date</li> <li>• Date stamp of applications</li> </ul>	

<b>Use Case name:</b> Create employee record		<b>ID:</b> FR6	
<b>Short Description:</b> Creates a new employee record every time a graduate is recruited.			
<b>Trigger:</b> A new employee is recruited.			
<b>Type:</b> <b>External</b> /Temporal			
<b>Major Inputs</b>		<b>Major Outputs</b>	
<u>Description</u>	<u>Source</u>	<u>Description</u>	<u>Destination</u>
New recruits' application form	Evaluate and recruit process	New employee data	Employee file
<b>Major Steps Performed</b>		<b>Information Required:</b>	
<ul style="list-style-type: none"> <li>• Make sure all required information is present</li> <li>• Store the data in the employee file</li> </ul>		<ul style="list-style-type: none"> <li>• Title</li> <li>• Name</li> <li>• Address</li> <li>• Qualifications</li> <li>• Previous work experience</li> <li>• Skills</li> <li>• Courses attended</li> <li>• Current department</li> </ul>
